

METHODS

This exercise gives you practice with parameters, return values, and scope. Find the exact output to the following code:

```
public class Methods
{
    public Methods()
    {
        int a = 40, b = 25;
        double c = 13, d = -2;
        System.out.println("To start, a - b = " + (a - b));
        int hello = north(a,b);
        System.out.println("Now, a - b = " + (a - b));
        System.out.println("north returned " + hello);
        System.out.println("c / d = " + c / d);
        double goodbye = south(c,d);
        System.out.println("Now, c / d = " + c/d);
        System.out.println("south returned " + goodbye);
    }

    public int north(int num1, int num2)
    {
        int temp = num1;
        num1 = num2;
        num2 = temp;
        System.out.println("num1 - num2 = " + (num1 - num2));
        return (3 * (num1 - num2));
    }

    public double south(double num3, double num4)
    {
        num3 += 24;
        num4 *= 2;
        System.out.println("num3 / num4 = " + (num3/num4));
        return (10 * (num3 + num4));
    }

    public static void main( String[] args )
    {
        Methods app = new Methods();
    }
}
```
